

## Seminar W1 - 916

### Algebra

→ the study of algebraic structures

$(S, \underbrace{*, \cdot, \dots}_{\text{operations}})$   
↓  
set

•  $\underbrace{*}_{\text{(binary) operation}}$  on a set  $S \Leftrightarrow * : S \times S \rightarrow S$   
 $(x, y) \mapsto x * y$   
↓  
internal law

•  $\forall$   $*$  operation on  $S$  and  $A \subseteq S$ , then:

A stable part of  $S$  if:  $\forall x, y \in A : x * y \in A$

Ex. of algebraic structures: monoids, groups, rings, fields  
(+ vector spaces)

Def:  $(G, *)$  group if:

- $*$  is an operation:  $\forall x, y \in G : x * y \in G$
- associativity:  $\forall x, y, z \in G : (x * y) * z = x * (y * z)$
- neutral element:  $\exists e \in G \forall x \in G : x * e = e * x = x$
- invertibility:  $\forall x \in G \exists x' \in G : x * x' = x' * x = e$

Semigroup

monoid  
Semigroup  
(monoid)

(+ Commutativity:  $\forall x, y \in G : x * y = y * x$ )  
 $\hookrightarrow$  abelian group

3. Decide which ones of the numerical sets  $\mathbb{N}, \mathbb{Z}, \mathbb{Q}, \mathbb{R}, \mathbb{C}$  are groups together with the usual addition or multiplication.

Sol:

	$\mathbb{N}$	$\mathbb{Z}$	$\mathbb{Q}$	$\mathbb{R}$	$\mathbb{C}$
+	No	Yes	Yes	Yes	Yes
.	No	No	No	No	No

5. Let " $*$ " be the operation defined on  $\mathbb{N}$  by  $x * y = \text{g.c.d.}(x, y)$ .

(i) Prove that  $(\mathbb{N}, *)$  is a commutative monoid.

(ii) Show that  $D_n = \{x \in \mathbb{N} \mid x/n\} (n \in \mathbb{N}^*)$  is a stable subset of  $(\mathbb{N}, *)$  and  $(D_n, *)$  is a commutative monoid.

(iii) Fill in the table of the operation " $*$ " on  $D_6$ .

(You can use the fact that  $\text{g.c.d.}(x, \text{g.c.d.}(y, z)) = \text{g.c.d.}(x, \text{g.c.d.}(y, z))$ ) (★)

Sol:

(i)  $\forall x, y \in \mathbb{N} : \text{g.c.d.}(x, y) \in \mathbb{N} \Rightarrow *$  operation on  $\mathbb{N}$

Associativity is proven by (★)

If  $e$  is a neutral element  
 $\gcd(x, e) = x \Rightarrow x | e \Rightarrow e : x$

We check that  $e = 0$ .

$$\forall x \in \mathbb{N} : \gcd(x, 0) = x$$

$$\forall x, y \in \mathbb{N} : x * y = \gcd(x, y) = \gcd(y, x) = y * x$$

Remark:  $n \in \mathbb{N}$ ,  $n = p_1^{\alpha_1} p_2^{\alpha_2} \dots p_n^{\alpha_n}$

$\forall p$  prime we define  $\mathcal{O}_p(n)$  = the power of  $p$  in the factorization of  $n$

in our case:  $\mathcal{O}_{p_1}(n) = \alpha_1, \dots, \mathcal{O}_{p_n}(n) = \alpha_n$

$\forall p \neq p_1, \dots, p_n : \mathcal{O}_p(n) = 0$

$$\bullet \mathcal{O}_p(ab) = \mathcal{O}_p(a) + \mathcal{O}_p(b)$$

$$\mathcal{O}_p(a+b) \geq \min(\mathcal{O}_p(a), \mathcal{O}_p(b))$$

$$\mathcal{O}_p(\gcd(a, b)) = \min(\mathcal{O}_p(a), \mathcal{O}_p(b))$$

(ii)  $(D_n, *)$  stable subset of  $(\mathbb{N}, *)$ ?

$$\forall x, y \in D_n : \gcd(x, y) \stackrel{?}{\in} D_n$$

We know  $x | n$ ,  $y | n$ , we want to show that  $\gcd(x, y) | n$

$$\left[ \begin{array}{l} \text{if } a|b \text{ and } b|c \Rightarrow a|c? \\ a|b \Rightarrow b = a \cdot k, k \in \mathbb{Z} \\ b|c \Rightarrow c = b \cdot m, m \in \mathbb{Z} \end{array} \right\} \Rightarrow c = a \cdot \underbrace{km}_{\in \mathbb{Z}} \Rightarrow a|c$$

$$\gcd(x, y) | x, x | n \Rightarrow \gcd(x, y) | n \Rightarrow$$

$$\Rightarrow \gcd(x, y) \in D_n \Rightarrow (D_n, *) \text{ stable part}$$

$$(D_n, *) \text{ commutative monoid?}$$

The associativity and commutativity are inherited from  $(\mathbb{N}, *)$

$0 \notin D_n \Rightarrow$  we need to look for another neutral element.

We can see that  $\forall x \in D_n$ :

$$x * n = n * x = \gcd(x, n) \stackrel{x|n}{=} x$$

$\Rightarrow n$  is the neutral element in  $(D_n, *)$

$$(iii) D_6 = \{1, 2, 3, 6\}$$

	1	2	3	6
1	1	1	1	1
2	1	2	1	2
3	1	1	3	3
6	1	2	3	6

7. Let  $(G, \cdot)$  be a group. Show that:

(i)  $G$  is abelian  $\iff \forall x, y \in G, (xy)^2 = x^2y^2$ .

(ii) If  $x^2 = 1$  for every  $x \in G$ , then  $G$  is abelian.

Sol: (i) " $\Rightarrow$ "  $\forall x, y \in G : (xy)^2 = \underbrace{xy}_{=xy} xy = x^2y^2$

" $\Leftarrow$ "  $(xy)^2 = xy xy = x^2y^2$

$$\stackrel{-1}{x} \mid xy xy = x^2y^2 \mid \cdot y^{-1}$$

$$\Rightarrow yx = xy \Rightarrow G \text{ abelian}$$

$$(ii) \left. \begin{array}{l} \text{Let } x, y \in G \Rightarrow (xy)^2 = 1 \\ x^2 = y^2 = 1 \end{array} \right\} \Rightarrow (xy)^2 = x^2y^2 \Rightarrow$$

$\stackrel{(i)}{\Rightarrow} G \text{ abelian}$
